WHITE ROMAN HYACINTH.

The Hyacinth

Directions for Culture in Pots

Select solid, heavy bulbs and plant as early as possible, using a six or seven inch pot for a single bulb. Fill the pots with a light, rich potting soil, and have the top of the bulb just above the surface, give a good watering and set away in a cool place, covering them with about five inches of sand or coal ashes. In about eight weeks they may be taken to the room in which they are to flower. By bringing in a few pots at a time about two weeks apart a succession of bloom may be had.

GLASS CULTURE

Single Hyacinths do better than double in glasses, as they produce a much larger and more showy truss. Place the bulb in the glass, which should be filled with water so it touches the bottom of the bulb, put it in a close box in a cool place or on a shelf in the dark part of the cellar, for from six to eight weeks, changing the water every ten days or two weeks, then remove them to the light. If then placed in a cool room they will produce very fine spikes and remain in bloom a long time. A small piece of charcoal in the water is beneficial.

PLANTING IN THE OPEN GROUND

October and November is the proper time, but they can be set out any time as long as the ground is open and the bulbs remain sound. The best compost for their culture is the following: One-third river or sea sand, one-third well-rotted cow manure, and one-third good garden mould. The beds composed of the above compost should be well dug to a depth of fourteen inches, and raised from two to four inches above the level of the walks. The bulbs should be planted evenly about six inches deep (to the bottom of the bulbs) and from five to six inches apart; *if planted at uneven depths they will not bloom at the same time, but irregularly.* Care must be taken not to press the earth too firmly around and over the bulbs, setting each bulb in a handful of clean sand, which insures drainage.

Single Named HYACINTHS

CHOICE EXTRA SIZE BULBS

FOR POTS AND GLASSES

IN making up the following list of varieties we have selected only such sorts as have proven to be the **BEST.** These are the **CREAM** of the Holland market. Extra sized roots produce perfectly shaped flowers of the clearest and most distinct colors. If a selection is made of the colors as below, a succession of bloom is also obtained; these varieties flower with very little intervention. In purchasing these Selected Named Bulbs the customer gets the finest spikes of perfect blooms that cannot be gotten from a common grade of mixed Hyacinths. For pot or glass culture the single kinds will be found to excel the double in profusion of flower.

Extra Selected Hyacinths

For Bedding and Forcing

These are grown specially for our trade and must not be confounded with the so-called Mixed Hyacinths sold by some, containing the cullings of the trade, immature, undersized bulbs. For massing in borders or design work, or for forcing they are well adapted. Our mixture is composed of bulbs which are nearly of the same height and flower simultaneously.

SINGLE HYACINTH.

Early White Roman HYACINTHS

For **forcing** purposes the Roman Hyacinth has no equal. If planted early in September and gently forced, will bloom in November, or its flowering may be deferred until Christmas by keeping it in a cool place. One bulb throws up a number of spikes, and the flowers are deliciously scented.

	Each	Per doz.	Per 100	Per 1000

Extra Selected, 13 to 15 ctms.,	10	75	4 50	40 00

Double Rose Pink Romans

This form of the Hyacinth is similar in appearance to the Single Roman, excepting in the flower, which is a very distinct double, exceedingly pretty and effective; stands a long time in flower. Price, 60c. per doz.; $4.00 per 100.

Single Light Blue Romans

Delicate, semi-double flowers on stiff stalks, of a pale-blue color, very fragrant. Keep a long time when cut and placed in water. Used for forcing and table decoration. Price, 50c. per doz.; $3.50 per 100.

Single Dark Rose Hyacinths

This pretty form of Hyacinth much resembles the well-known White Roman Hyacinths, except in color. They come into blossom about ten days later, taking the place of many of the early flowering bulbs long past bloom. Their delicate shades of color form a pleasing contrast when placed among ther flowers and plants. Price, 50c. per doz.; $3.50 per 100.

ITALIAN HYACINTHS

These, like the French Roman Hyacinths, are grown largely for cutting. Flowers single, graceful and fragrant. Hardier than the Romans, and may be planted outside in the fall for early spring cutting.

Single White Italian. Each, 6c.; per doz., 50c.; per 100, $3.50.

WHITE MOUNTAIN HYACINTHS

The White Mountain Hyacinth resembles the White Roman, and is one of the best for forcing. They generally throw several spikes of bloom, but when only one flower is given it is as large and very similar to that of a Second Size Dutch Hyacinth. Price, 50c. per doz.; $3.50 per 100.

MINIATURE HYACINTHS

Bulbs under this heading are much smaller than the ordinary Dutch Hyacinths, and are extensively used for forcing. They are more attractive than the French Romans, and when properly forced, throw very fine spikes of bloom. They have proved perfectly hardy, slightly protected, and are fine for cutting purposes.

Named Hyacinths

SECOND SIZE BULBS

For customers not wishing to purchase the first size named bulbs, the following sorts have proven to be the very best. They produce well-shaped, full and compact spikes. It pays well to plant only the named sorts, as they are far superior to the regular separate color quality, which we recommend for outside planting.

Single Pink. Gigantea; Chas. Dickens; Baron V. Thuyll.

Single Red. Gen'l Pelissier; Rob. Steiger; Gertrude.

Single White. Alba Superbissima; La Grandesse; Baron V. Thuyll; Mme. Van der Hoop.

GRAPE HYACINTHS.

Single Named TULIPS

NOTHING is more beautiful than a bed of Tulips in the spring. They are the showiest flower in bloom at that time of year. They should be planted in beds about four inches apart, and four inches deep. Tulips are also excellent for growing in the house; four or five bulbs to six or seven inch pots, or they can be forced in the greenhouse with good results. For forcing, Single Tulips are the best, Duc Van Thol varieties being the favorites, as they flower earlier on account of their dwarf habit.

The figures indicating the average height are given before each variety, to aid selection of beds.

W. & D.'s Special Mixed Single Tulips

THIS MIXTURE CONTAINS AN ELEGANT ASSORTMENT OF ALL THE COLORS.
Price, 20c. per doz.; $1.25 per 100; $9 per 1000

Varieties prefixed by an asterisk (*) are the earliest sorts.

Double Named TULIPS

THE earlier varieties of this class of tulips are admirably adapted for forcing. Many of the other varieties make a fine display when grown in pots, but they should be forced slowly. The later kinds are very effective for bedding, producing a dense mass of gorgeous flowers, which remain in bloom a long time.

Double Tulips are very handsome, especially when planted in separate colors, such as scarlet, white and yellow. A most brilliant display can be had by placing them in square, diamond, or round-shaped beds, and we shall be pleased to name the varieties most suitable for this purpose if so desired. Double Tulips remain longer in bloom than the single varieties, therefore should not be planted together.

By taking them in at intervals a succession of flowers may be kept up all winter. They are also forced in immense quantities by florists, but they are the most charming when grown in large patches, in partially shaded localities around the lawn, near the borders of streams, lakes, etc., being perfectly hardy.

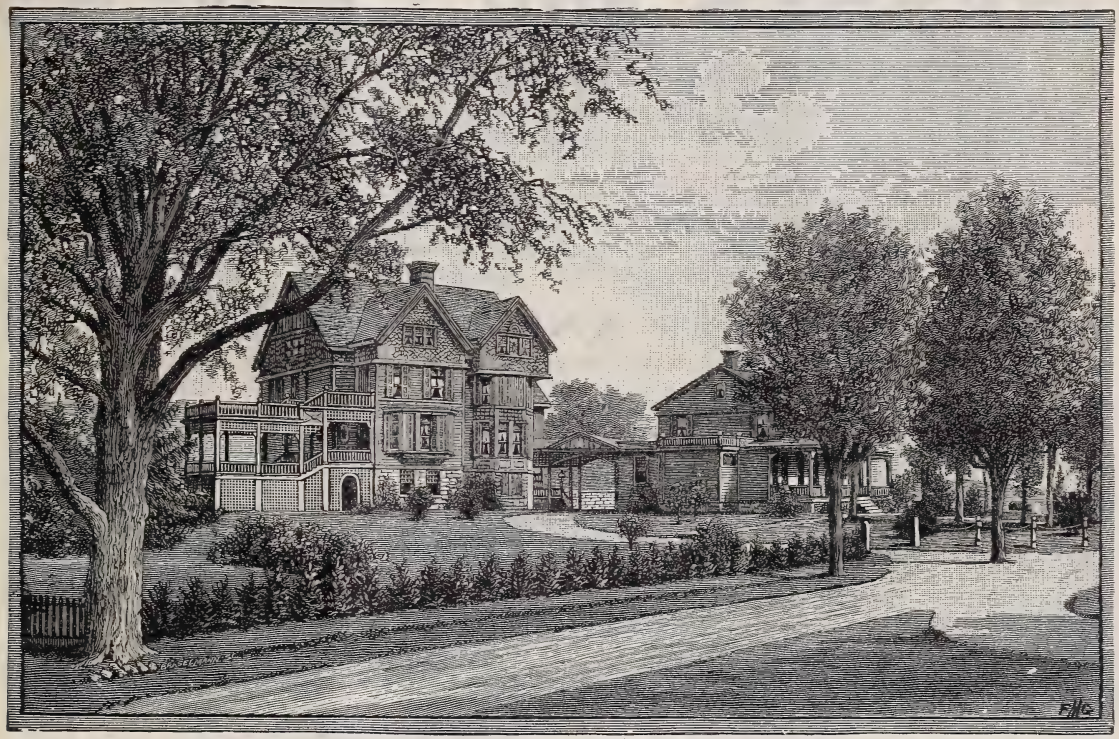
WEEBER & DON'S
Central Park Lawn Grass Seed



(Weight, 20 Pounds per Bushel.)

OUR formula for this mixture embraces all the most desirable dwarf evergreen grasses which flourish at different seasons, ensuring a permanent verdure. The varieties used are those which form a compact sward, excluding the chances of burning out from excessive heat in summer. The seeds are of the choicest quality, free from obnoxious weeds and foreign substances, thus providing an absolutely clean and velvety lawn. Seed sown in the fall will produce a fine, luxuriant lawn the following season. We recommend using **four bushels of seed to the acre;** the thicker the seed is sown the sooner a smooth perfect lawn will be obtained. One quart of seed soil will sow a space 15 x 20 feet.

Price, per quart, 25c.; per peck, $1.25; per bushel, (20 lbs.), $4.50.

WEEBER & DON'S

Sure Crop Mushroom Spawn

A FEW DIRECTIONS FOR FORMING MUSHROOM BEDS

THE Mushroom is one of the most profitable crops grown, especially in the vicinity of large cities, where the demand, at all seasons, is far in excess of the supply. The best time for making mushroom beds is in August and September, as in the fall months the natural heat is sufficient to cause the spawn to germinate freely, and the beds made then ought to bear well before and up to Christmas. Mushrooms can be grown in sheds, cellars, caves, under benches in greenhouses, and in regular mushroom houses.

In preparing the materials, collect sufficient fresh horse droppings to form the desired size of bed, spreading them out in an airy shed to dry, and turning them frequently. When in a proper state as to dryness, which will soon be learned by experience, make these into a bed from nine inches to one foot thick, beating them firmly together. If the droppings have been properly prepared, gentle fermentation will soon commence, and when the temperature of the bed is from 75° to 80°, with no danger of its rising higher, put in the spawn. This is done by making shallow holes, about nine inches apart, inserting pieces of spawn about the size of a hen's egg, and covering with the dung, pressing this closely about the spawn. It is of the greatest importance that the temperature of the bed should not decline below 75°, nor rise above 80° for a month after spawning. Within a fortnight after putting in the spawn cover the bed about two inches thick with good mellow, moist soil, making this firm, and if under this a covering one or two inches thick of cow dung, in about the same condition in moisture as the soil, can be afforded, this will cause the bed to last longer, and also to produce a larger crop than if covered with soil only. The most suitable temperature for beds in bearing is 50° to 55°, and as a high temperature causes the mushrooms to come small, this should be avoided. Watering beds in bearing often causes the small mushrooms to damp off; therefore, water only when the bed ceases to be productive, and then use the water about the same temperature as the bed.
